SATELEC's answer to  
veterinary scaling

# P-5 Vet

The most powerful and compact veterinary scaler around

25% of dogs aged one to four years suffer from gingivitis and 75% of dogs between four and eight years old suffer from periodontitis, which can lead to serious gingival recession.

For this reason, veterinarians need to alert dog owners about the development of periodontal disease in their pets, which occurs **five times faster** than in humans.

Professional dental cleaning and prophylactic treatment of the gingiva must complement prevention with proper nutrition and brushing, etc.

All specialists agree that the use of ultrasonic appliances is the most efficient treatment available, especially when compared to treatment with manual instruments:

- Total elimination of calculus, deposits and discoloration, as well as the elimination of bacterial plaque, is faster.
- The risk of scratching the enamel and the roots is reduced.
- Cavitation (the implosion of developing micro bubbles of oxygen) combines the efficiency of a physico-chemical reaction with the mechanical effect of ultrasonic tips and has the added advantage of a bacteriostatic effect.
- Disinfectant products can be added to the spray which irrigates the operating field.

The new SUPRASSON® P5 Vet from SATELEC, specially adapted to the practice of veterinary dentistry on small animals, allows you to ensure:

- Prevention and hygiene treatments (supra- and subgingival scaling)
- The treatment of gum diseases (periodontics: pocket debridement, root planing)
- Root canal treatment (endodontics: irrigation, devitalization, disinfection and reshaping of the canal).

The SUPRASSON P5 Vet offers the veterinarian a wide choice of instruments, simple and efficient adjustment, and a separate irrigation system for the professional maintenance of the dentition of small animals.

SATELEC, the leader in the veterinary dentistry market, has been working closely with veterinary professionals for over 20 years to improve the performance of ultrasonic generators and to offer a wide choice of ultrasonic instruments adapted to veterinary care.

Today, with the SUPRASSON P5 Vet, you can enjoy the benefits of the latest generation of veterinary instruments using SATELEC's exclusive technology:

- The ultrasonic generator unit is compact and easily integrated into the veterinary surgery layout.
- One control button allows you to adjust power for the different operating modes: **SOFT** mode for the treatment of pockets and root planing, **MEDIUM** mode for subgingival scaling or endodontic treatment, and **BOOST** mode for supragingival scaling.
- The SUPRASSON handpiece uses piezoelectric technology (more power, more flexible regulation, and less heating).
- The spray, which can be adjusted precisely using the knob on the side of the unit, allows you to irrigate the zone being treated while preserving excellent visibility of the operating field.
- The linear movement of the ultrasonic tips allows for perfect control of the practitioner's movements, whatever the type of operating field.
- The SATELEC range of tips probably offers the greatest choice of ultrasonic tips available in the veterinary dentistry market today.
- The separate pump enables installation of the device in any surgery layout (power connection also possible).
